

Hundreds - Google Ads API Design Document

Application: Hundreds (SEO Hundreds) | Version 1.0 | June 2026

Google Ads API v20 | Requested access: Basic (read-only reporting)

1. Application overview

Hundreds is a web application for small business owners who are not professional marketers. Users connect their own Google Ads account via OAuth. Hundreds reads recent campaign performance and combines it with the user's business goal to generate a plain-English 8-week marketing action plan.

Hundreds does NOT create, edit, pause, or bid on campaigns. It does NOT manage budgets or billing. All Google Ads API usage is read-only reporting to personalize recommendations shown only to the authenticated account owner.

2. Purpose of Google Ads API use

Users need actionable marketing advice grounded in their real ad performance. The API provides automated read-only snapshots (spend, clicks, conversions, top campaigns) when a user requests a new plan. This avoids manual copy-paste from the Ads UI and allows plans to cite actual metrics with appropriate confidence levels.

3. API operations used (read-only)

Operation 1: customers:listAccessibleCustomers (GET)

- Purpose: Let the user select which Ads customer account to link to their workspace.
- Write access: No.

Operation 2: customers/{customerId}/googleAds:search (POST, GAQL)

- Purpose: Read campaign name, cost, conversions, clicks, impressions for LAST_30_DAYS.
- Write access: No.
- Typical query limits results to 15 campaigns ordered by spend.

NOT used: CampaignService mutate, AdGroupService mutate, billing, budget changes, automated bidding, or any administrative write operations.

Estimated API volume: Low. Approximately one search request per plan generation per workspace, a few times per week per active user. Well under Basic Access daily limits.

4. System architecture

End user (browser)

- > OAuth 2.0 with Google (adwords scope)
- > Hundreds Web App (Next.js) over HTTPS
- > Hundreds API Server (Node.js)
 - > Google Ads API v20 (developer-token + user OAuth token)
 - > PostgreSQL database (Supabase): encrypted tokens, customer ID, plan JSON
 - > Anthropic Claude API: plan text generation from metric summary only

Each customer workspace (organization) is isolated. Users only access data for accounts they personally authorized through Google OAuth.

5. Authentication and authorization

1. User signs in to Hundreds (email/password via Supabase Auth).
2. User initiates Connect Google Ads from the Integrations page.
3. Google OAuth 2.0 authorization with scope <https://www.googleapis.com/auth/adwords>.

4. User selects an accessible customer account; customer ID is stored per workspace.
5. Access and refresh tokens are encrypted at rest using AES-256 (application encryption key).
6. API requests include the user's OAuth bearer token and our developer token.
7. Users can disconnect at any time; stored tokens are deleted.
8. All API routes require authenticated user plus verified workspace membership.

6. Data handling and privacy

OAuth tokens: Stored encrypted until user disconnects. Not shared with third parties.

Customer ID: Stored per workspace until changed or disconnected.

Campaign metrics: Fetched on demand; summarized as text for plan generation. Full API responses are not exported or resold.

AI processing: A text summary of metrics is sent to Anthropic Claude to generate plan recommendations. Users connect integrations knowingly.

Compliance: Google Ads API Terms of Service and Google OAuth policies are followed. We do not sell or redistribute Google Ads data.

7. End-user flow

1. User creates or joins a workspace.
2. User connects Google Ads via OAuth and selects a customer account.
3. User enters a marketing goal and starts a new plan.
4. Backend executes read-only GAQL snapshot (last 30 days).
5. Snapshot text is included in an internal prompt; AI returns a structured 8-week plan.
6. User views the plan in the application. No changes are made in Google Ads.

8. Security measures

HTTPS for all client and server communication.

Developer token and encryption keys stored in server environment variables only.

Multi-tenant isolation: `organization_id` on all data; `X-Organization-Id` header on API calls.

Version 1 is read-only: no mutate endpoints are implemented or planned without explicit user approval flows in a future phase.

9. Future scope (not included in v1)

Possible future features (subject to separate review and explicit user approval):

- Scheduled metric refresh
- User-approved campaign changes with audit log

Version 1 commitment: Read-only reporting via `listAccessibleCustomers` and `googleAds:search` only.

10. Summary for Google Ads API review

Hundreds uses the Google Ads API solely to READ campaign performance for authenticated small business users and to personalize marketing plans inside our application. We request Basic Access to query production accounts that users explicitly connect. We do not automate ad creation, bidding, budget changes, or account administration.

Applicant: Hundreds / SEO Hundreds
